Deploying Node App to Heroku

1) Install Heroku CLI
   (https://devcenter.heroku.com/articles/getting-started-with-nodejs#set-up)
2) Create a node project (run **npm init** inside a folder).
3) Initialize a git repo (git init)
4) Add a **Procfile** to your project. The Procfile will be used to jump start your application. Here are the contents of the Procfile:

   ```
   web: node app.js
   ```

5) Update your **app.js** code to tell heroku to assign the port to your app. Check out the following code:

   ```
   const PORT = process.env.PORT || 8080
   ```

6) **Commit** your code to local repository
7) Run **heroku create** (On the website it says to perform heroku login but it does not work for some reason)
8) Push branch to Heroku **git push heroku master**
9) The website will be deployed. You can use the website link displayed in the **console** or you can use heroku dashboard to **open** your app.
